n Lake Burullus (Egypt) - III.- Selective Feeding of Mugil cephalus and Liza ramada Fish Populations in

C.-F. H. HOSNY* and M.-T. HASHEM**

*Oceanography Department, Faculty of Science, Alexandria University (Egypt) **National Institute of Oceanography and Fisheries, Alexandria (Egypt)

ine food The food preferences and feeding patterns for different size i.e. youngs-of-the-year (group I), yearlings (group II) and (group III), of <u>Mugil cephalus</u> and <u>Liza ramada</u> from Lake was studied using three methods of analysis. groups, adults Burullus

betric method of RICKER (1941) demonstrated the of both species based on a high correlation between sand particles and the occurrence of foraminifera in The volumetric of sar of the ing parts existence o Tons of feeding the individuals under consideration, on one hand, stomachs the and detritus vs. the availability of bottom animals such as nuelids, on the other hand. It should be mentioned, tal particles in the stomach of mullets were not of the amount unu annel uweyer, detrital considered ac the annelids. molluscs and annelids, on the other hand. It should be mentioned, however, detrital particles in the stomach of mullets were not considered as prey since ODUM (1970) have proved that mullets utilize the organic fraction of the soft mud deposited in coastal lagoons and are able to concentrate them in their bodies by a factor of 100:1.

The results <u>ramada</u> feed in mid-searching for forami therefore, that young-of-the-year <u>L</u> ile older fish eat close to the bettom annelids among sand that constitutes suggest. The results suggest, therefore, that young-of-the-year <u>L</u> ada feed in mid-water, while older fish eat close to the bcttom rching for foraminifera and annelids among sand that constitutes 5% of the food ingested. While adult fish tend to feed in mid-water epiphytic algae attached to the surface of hydrophytes. In the case <u>M. cephalus</u>, on the other hand, young-of-the-year were found to feed r the surface, and as the fish grow older they tend to feed close to bottom and scratching enpiptic algae addread to hydrophytes. 17.5% on of near the surface, and as the fish grow older they tend to feed close to the bottom and scratching epiphytic algae adhered to hydrophytes. The numerical method of HYNES (1950) suggested the possible

he numerical in the feed transform in the feeding habits of mullets in the lake. Thus <u>M</u>, <u>cephalus</u> was found to be strictly carnivorous as young-of-the-year and becomes omnivorous as adult. <u>L</u>, <u>ramada</u>, however, was found to be highly versatile in its feeding habits, the young-of-the-year were found to cephalus we comprove as adult. <u>...</u> becomes omnivorus as adult. <u>...</u> versatile in its feeding habits, the young-o.... consume plant prey at a relatively higher level than animal pre yearling fish, on the contrary, were found to consume more anima than plants. The situation is reversed again in adult individuals. The electivity index of IVELV (1961) demonstrate the heavior of the different size groups of mullets is that <u>M. cephalus</u> will prefer animal to the young-of-th level than animal prey. The animal prey

demonstrated the

than plants. He electivity index of IVELV (1961) demonstrates The electivity index of IVELV (1961) demonstrates selective behavior of the different size groups of mullets in lake Burullus. It was found that <u>M. cephalus</u> will prefer animal to plant matter, this is quite clear especially in the young-of-the-year individual, where strongly selective feeding of animal diet occurs. In the yearling and adult fish, however, the diet seem to be rather balanced, yet it is still deviated towards animal matter of the sedentary nature, suggesting that the individual of this species feed closer to the bottom as they grow older. Table 1 showed that the amount of sand, detritus increase soundly in older individuals as they are accidentally ingested while the fish is seeking for its target animal prey. For <u>L. ramada</u>, on the other hand, the diet is more deviated to the plant matter of the diet options. Even with regard to plant matter, selectivity is discernible with preference to Dinoflagellates, green the user and yearling

For <u>L. ramaue</u>, ... plant matter of the diet options. Even with ... ctivity is discernible with preference to Dinoflagellates, green blue-green algae to diatoms. Moreover, adult individuals have much a choice in their plant diet than young-of-the-year and yearling samada eats a larger variety of animal matter positive selection to of a choice in their plant diet than young-of-the-year and yearling individuals. Yearling <u>L. ramada</u> eats a larger variety of animal matter than the other size groups, this species have a positive selection to cladocerans. On the other hand, it is strikingly obvious that <u>L. ramada</u> of any size does not at all feed on molluscs, nematodes, or ostracods.

Electivity index of food items ingested by different size groups of $\underline{M}_{...}$ cephalus and $\underline{L}_{...}$ ramada from Lake Burullus during 1987.

Food Items	M. cephalus			L. ramada		
	Gp I	Gp II	Gp III	Gp I	Gp II	Gp III
Diatoms	-0.80	-0.77	-0.66	-0.41	-0.87	-0.87
Chlorophytes	-1.00	-0.66	+0.64	-1.00	-0.24	+0.67
Cyanophytes	-0.79	+0.40	-0.10	-0.71	+0.31	+0.14
Dinoflagellates	-1.00	+0.76	-0.58	+0.91	-1.00	+0.85
Foraminifera	-1.00	+0.28	+0.54	-1.00	+0.67	+0.70
Annelids	-1.00	-1.00	+0.99	-1.00	+0.99	-1.00
Copepods	+0.34	-0.39	+0.11	-1.00	-1.00	-1.00
Molluscs	-1.00	+0.99	-1.00	-1.00	-1.00	-1.00
Nematodes	+0.99	+0.98	+0.98	-1.00	-1.00	-1.00
Ostracods	+0.78	+0.70	-1.00	-1.00	-1.00	-1.00
Cladocerans	+0.77	+0.64	+0.64	+0.83	+0.75	+0.63
